hacking
Most Common Attack

Hacking and error-based incidents are the two dominant attack patterns, but they require fundamentally different responses. Hacking demands technical controls; error demands process governance and human oversight. The rise of error-driven incidents in Public Administration (46%) points directly to failures in change management and operational oversight at board level.

Avg Governance Risk…

Year
2010 2025

Self-detection rates peaked at 30% in 2018 and have since declined sharply to under 5% by 2023–2025, while external detection has surged to over 90%. This indicates deteriorating internal detection capability sector-wide, a direct governance failure at board and senior management level.
